DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) and the Intellectual Property and High Technology Technical Amendments Act of 2002 do not apply when the reference is a U.S. patent resulting directly or indirectly from an international application filed before November 29, 2000. Therefore, the prior art date of the reference is determined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

Claim Rejections - 35 USC § 103

2. Claims 5-6, 11-12 are rejected under 35 U.S.C. 102(e) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over Barker et al. (6,528,033).

Barker et al. teaches in column 1, lines 1-50, lithium batteries containing a negative electrode, a positive electrode and an electrolyte. Barker et al. teaches in column 15, Example III, a positive electrode material comprising LiFePO₄ and teaches

in column 17, Example VIII, a positive electrode material comprising $\text{LiFe}_{0.9}\text{Zn}_{0.1}\text{PO}_4$ ($\text{LiFe}_{1-y}\text{Zn}_y\text{PO}_4$). Barker et al. teaches in column 2, lines 10-36, a battery comprising the positive electrode material. Barker teaches in the examples mixing the premix reactants, palletizing the powder mixture, heat at 750 degrees C.

Since Barker et al. teaches the same positive electrode active material containing a compound represented by LiFePO_4 or $\text{Li}_x(\text{Fe}_y\text{M}_{1-y})\text{PO}_4$ where $x=1$, then inherently the same positive electrode active material in which a spectrum obtained by the Moessbauer spectroscopic method, A/B is less than 0.3, must also be obtained.

In addition, the presently claimed property of a transition metal compound exhibiting a potential of not lower than 4.5 volts versus Li would have obviously have been present once the Shigeo product is provided. *In re Best*, 195 USPQ 433 (CCPA 1977).

Allowable Subject Matter

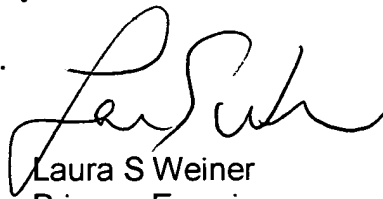

3. Claims 13-15 are allowed. No reference was found teaching sintering at a temperature between 400-700 degrees C.
